(54) Title: **HETEROARYLHETEROALKYLAMINE DERIVATIVES AND THEIR USE AS INHIBITORS OF NITRIC OXIDE SYNTHASE**

(57) Abstract: There are provided novel compounds of formula (I) [Chemical formula should be inserted here. Please see paper copy] wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, T, U, X, Y, V and W are as defined in the specification, and pharmaceutically acceptable salts thereof; together with processes for their preparation, compositions containing them and their use in therapy. ## HETEROARYLHETEROALKYLAMINE DERIVATIVES AND THEIR USE AS INHIBITORS OF NITRIC OXIDE SYNTHASE

### Field of the Invention

- 5 The present invention relates to novel heteroarylheteroalkylamine derivatives, processes for their preparation, compositions containing them and their use in therapy.

### Background of the Invention

- 10 Nitric oxide is produced in mammalian cells from L-arginine by the action of specific nitric oxide synthases (NOSs). These enzymes fall into two distinct classes - constitutive NOS (cNOS) and inducible NOS (iNOS). At the present time, two constitutive NOSs and one inducible NOS have been identified. Of the constitutive NOSs, an endothelial enzyme (eNOS) is involved with smooth muscle relaxation and the regulation of blood pressure  
15 and blood flow, whereas the neuronal enzyme (nNOS) appears to be involved in the regulation of various biological functions. Inducible NOS has been particularly implicated in the pathogenesis of inflammatory diseases. Regulation of these enzymes should therefore offer considerable potential in the treatment of a wide variety of disease states (J. E. Macdonald, *Ann. Rep. Med. Chem.*, 1996, 31, 221 - 230).

20

Considerable effort has been expended to identify compounds that act as specific inhibitors of one or more isoforms of the enzyme nitric oxide synthase. The use of such compounds in therapy has also been widely claimed.

The present invention includes compounds of formula (I) in the form of salts, in particular acid addition salts. Suitable salts include those formed with both organic and inorganic acids. The reaction may be carried out in a solvent or medium in which the salt is insoluble or in a solvent in which the salt is soluble, for example, water, dioxane, ethanol, tetrahydrofuran or diethyl ether, or a mixture of solvents, which may be removed *in vacuo* or by freeze drying. The reaction may also be a metathetical process or it may be carried out on an ion exchange resin.

wherein  $R^2$  and  $R^3$  are as defined in formula (I), and G represents H, Cl or  $NCH_3(OCH_3)$ ,  
with an organometallic derivative,  $R^1-M$ , wherein  $R^1$  is as defined in formula (I) and M

15 details of processes for their removal may be found by reference to the standard text  
"Protective Groups in Organic Synthesis", 3rd Edition (1999) by Greene and Wuts.

The compounds of the invention and intermediates thereto may be isolated from their reaction  
mixtures and, if necessary further purified, by using standard techniques.

- 5 We are particularly interested in the conditions stroke, Alzheimer's disease, Parkinson's disease, multiple sclerosis, schizophrenia, migraine, septic shock and pain; more particularly migraine.

Prophylaxis is expected to be particularly relevant to the treatment of persons who have  
10 suffered a previous episode of, or are otherwise considered to be at increased risk of, the disease or condition in question. Persons at risk of developing a particular disease or condition generally include those having a family history of the disease or condition, or those who have been identified by genetic testing or screening to be particularly susceptible to developing the disease or condition.

15

For the above mentioned therapeutic indications, the dosage administered will, of course, vary with the compound employed, the mode of administration and the treatment desired. However, in general, satisfactory results are obtained when the compounds are administered at a dosage of the solid form of between 1 mg and 2000 mg per day.

20

The compounds of formula (I), and pharmaceutically acceptable derivatives thereof, may be used on their own, or in the form of appropriate pharmaceutical compositions in which the compound or derivative is in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier. Thus, another aspect of the invention provides a pharmaceutical composition  
25 comprising a compound of formula (I) or a pharmaceutically acceptable salt thereof, in admixture with a pharmaceutically acceptable adjuvant, diluent or carrier. Administration may be by, but is not limited to, enteral (including oral, sublingual or rectal), intranasal, inhalation, intravenous, topical or other parenteral routes. Conventional procedures for the selection and preparation of suitable pharmaceutical formulations are described in, for  
30 example, "Pharmaceuticals - The Science of Dosage Form Designs", M. E. Aulton, Churchill Livingstone, 1988. The pharmaceutical composition preferably comprises less than

80% and more preferably less than 50% of a compound of formula (I), or a pharmaceutically acceptable salt thereof.

There is also provided a process for the preparation of such a pharmaceutical composition  
5 which comprises mixing the ingredients.

The compounds of formula (I), and pharmaceutically acceptable derivatives thereof, may also be advantageously used in combination with a COX inhibitor, more particularly in combination with a COX-2 inhibitor. Particularly preferred COX-2 inhibitors are Celecoxib  
10 and MK-966. The NOS inhibitor and the COX-2 inhibitor may either be formulated together within the same pharmaceutical composition for administration in a single dosage unit, or each component may be individually formulated such that separate dosages may be administered either simultaneously or sequentially.

15 The invention is illustrated, but in no way limited, by the following examples:

### Screens

The pharmacological activity of compounds according to the invention may be assessed using the following screens.

15

#### Screen 1

The activity of compounds of formula (I), or a pharmaceutically acceptable salt thereof, may be screened for nitric oxide synthase inhibiting activity by a procedure based on that of  
20 Förstermann *et al.*, Eur. J. Pharm., 1992, **225**, 161-165. Nitric oxide synthase converts  $^3\text{H}$ -L-arginine into  $^3\text{H}$ -L-citrulline which can be separated by cation exchange chromatography and quantified by liquid scintillation counting.

Enzyme is prepared, after induction, from the cultured murine macrophage cell line J774A-1  
25 (obtained from the laboratories of the Imperial Cancer Research Fund). J774A-1 cells are cultured in Dulbeccos Modified Eagles Medium (DMEM) supplemented with 10% foetal bovine serum, 4 mM L-glutamine and antibiotics (100 units/ml penicillin G, 100 mg/ml streptomycin & 0.25 mg/ml amphotericin B). Cells are routinely grown in 225  $\text{cm}^3$  flasks containing 35 ml medium kept at 37 °C and in a humidified atmosphere containing 5%  $\text{CO}_2$ .

30

Nitric oxide synthase is produced by cells in response to interferon- $\gamma$  (IFN $\gamma$ ) and lipopolysaccharide (LPS). The medium from confluent culture flasks is removed and replaced with 25 ml (per flask) of fresh medium containing 1 mg/ml LPS and 10 units/ml IFN $\gamma$ . After a period of 17-20 hours in culture, harvesting of cells is accomplished by scraping the cell sheet from the flask surface into the culture medium. Cells are collected by centrifugation (1000 g for 10 minutes) and lysate prepared by adding to the cell pellet a solution containing 50 mM Tris-HCl (pH 7.5 at 20 °C), 10% (v/v) glycerol, 0.1% (v/v) Triton-X-100, 0.1 mM dithiothreitol and a cocktail of protease inhibitors comprising leupeptin (2 mg/ml), soya bean trypsin inhibitor (10 mg/ml), aprotinin (5 mg/ml) and phenylmethanesulphonyl fluoride (50 mg/ml).

For the assay, 25  $\mu$ l of substrate cocktail (50 mM Tris-HCl (pH 7.5 at 20 °C), 400  $\mu$ M NADPH, 20  $\mu$ M flavin adenine dinucleotide, 20  $\mu$ M flavin mononucleotide, 4  $\mu$ M tetrahydrobiopterin, 12  $\mu$ M L-arginine and 0.025 mCi L-[ $^3$ H] arginine) is added to wells of a 96 well filter plate (0.45 $\mu$ m pore size) containing 25  $\mu$ l of a solution of test compound in 50 mM Tris-HCl. The reaction is started by adding 50  $\mu$ l of cell lysate (prepared as above) and after incubation for 1 hour at room temperature is terminated by addition of 50  $\mu$ l of an aqueous solution of 3 mM nitroarginine and 21 mM EDTA.

Labelled L-citrulline is separated from labelled L-arginine using Dowex AG-50W. 150  $\mu$ l of a 25% aqueous slurry of Dowex 50W (Na $^+$  form) is added to the assay after which the whole is filtered into 96 well plates. 75  $\mu$ l of filtrate is sampled and added to wells of 96 well plates containing solid scintillant. After allowing the samples to dry the L-citrulline is quantified by scintillation counting.

In a typical experiment basal activity is 300 dpm per 75  $\mu$ l sample which is increased to 1900 dpm in the reagent controls. Compound activity is expressed as IC $_{50}$  (the concentration of drug substance which gives 50% enzyme inhibition in the assay) and aminoguanidine, which gives an IC $_{50}$  (50% inhibitory concentration) of 10  $\mu$ M, is tested as a standard to verify the procedure. Compounds are tested at a range of concentrations and from the inhibitions

obtained  $IC_{50}$  values are calculated. Compounds that inhibit the enzyme by at least 25% at 100  $\mu$ M are classed as being active and are subjected to at least one retest.

### Screen 2

5

Recombinant human NO synthases (iNOS, eNOS & nNOS) were expressed in *E. coli* and lysates were prepared in Hepes buffer (pH 7.4) containing co-factors (FAD, FMN,  $H_4B$ ), protease inhibitors, lysozyme and the detergent, CHAPS. These preparations were used, at suitable dilution, to assess inhibition of the various isoforms. Inhibition of NOS was determined by measuring the formation of L- $[^3H]$ citrulline from L- $[^3H]$ arginine using an adaptation of the method of Förstermann *et al.*<sup>9</sup> Enzyme assays were performed in the presence of 3  $\mu$ M  $[^3H]$ arginine, 1 mM NADPH and other co-factors required to support NOS activity (FAD, FMN,  $H_4B$ , calmodulin,  $Ca^{2+}$ ). Since various NOS inhibitors have been reported to exhibit slow binding kinetics, or to inactivate the enzyme in a time dependent manner, enzyme and inhibitor were pre-incubated for 60 min in the presence of NADPH before addition of arginine to initiate the reaction. Incubations continued for a further 60 min before the assays were quenched and  $[^3H]$ citrulline separated from unreacted substrate by chromatography on Dowex-50W resin in a 96-well format.

20 In the above screen, the compounds of Examples 1 to 16 were tested and gave  $IC_{50}$  values of less than 10  $\mu$ M against the iNOS and nNOS enzymes, and showed good selectivity with respect to the inhibition of eNOS, indicating that they are expected to show useful therapeutic activity.

### 25 Screen 3

Compounds also show activity against the human form of induced nitric oxide synthase as can be demonstrated in the following assay.

30 The human colorectal carcinoma cell line, DLD-1 (obtained from the European Collection of Animal Cell Culture - cell line number 90102540) was routinely grown in RPMI 1640 supplemented with 10%(v/v) foetal bovine serum, and 2mM L-glutamine, at 37 °C in

5% CO<sub>2</sub>.

- Nitric oxide synthase was induced in cells by addition of medium containing human recombinant gamma-IFN (1000 units/ml), TNF-alpha (200 U/ml), IL-6 (200 U/ml) and IL-1-beta (250 U/ml). After incubation for 18 hours at 37 °C, the medium was removed and the cells washed with warm phosphate buffered saline. Cells were incubated for a further 5 hours at 37 °C / 5% CO<sub>2</sub> in RPMI 1640 containing 100µM L-arginine and 100µM verapamil-HCl in the presence and absence of test compounds.
- 10 Nitrite accumulation was determined by mixing an equal volume of culture media with Griess reagent (10 mg/ml sulphanilamide, 1 mg *N*-(1-naphthyl)ethylenediamine in 1 ml 2.5% (v/v) phosphoric acid). Inhibition in the presence of compounds was calculated relative to the nitrite levels produced by untreated cells. IC<sub>50</sub> values were estimated from a semi-log plot of % inhibition versus concentration of compound.
